Pediatric Trauma Care II-AHC Media, LLC 2014-03-17 Pediatric trauma continues to have a significant impact on the health and well-being of children in the United States. Trauma continues to be the leading cause of death in children 1 to 18 years of age and accounted for more than 14,000 deaths among all children 0 to 18 years of age. In 2008, there were more than 8.6 million nonfatal injuries among newborn to 18-year-olds, with an injury rate of greater than 1 in 10. There is little debate that a coordinated effort and pediatric- specific advances in pediatric trauma systems, prehospital care and hospital care, and injury prevention can have a positive impact on pediatric trauma outcomes in the United States. However, there are still gaps in access to centers that deliver pediatric-focused trauma care, especially in rural areas. Furthermore, there are differing views between different centers regarding the optimal approach to the initial evaluation and management of the pediatric trauma patient. This book is targeted to review critical aspects of the care of the pediatric trauma patient, highlighting the most common and critical injuries encountered in the acute care setting.

Trauma Surgery-Ozgur Karcioğlu 2018-09-19 Although trauma victims constitute around one-tenth to one-eighth of the total patient volume in hospital emergency departments, the burden of trauma on humankind is beyond these statistics. The twenty-first century is witnessing a growing threat on human beings imposed by many sources, namely natural disasters, terrorism and other conflicts, warfare, and transportation accidents; all of which ignite the rise of major trauma incidents worldwide. Physicians, therefore, get involved in trauma management more and more frequently in time. They need to evaluate, diagnose, treat, and stabilize victims and help them take part in active and productive life as soon as possible. Technological advances have provided many techniques to augment trauma care and resuscitation, fracture healing, wound care, casts and splints, sutures, and transfusions. However, the successful management of trauma warrants a collaboration of emergency medicine, surgical disciplines, intensive care medicine, and almost all the resources of a hospital. This work is an example of a multidisciplinary approach that is a must to maximize synergistic efforts to deliver contemporary care for trauma victims of all ages throughout the world.

PHTLS: Prehospital Trauma Life Support for First Responders Course Manual-National Association of Emergency Medical Technicians (NAEMT) 2019-12 In the field, seconds count. PHTLS: Prehospital Trauma Life Support for First Responders, Second Edition teaches and reinforces the principles of rapidly assessing a trauma patient using an orderly approach, immediately treating life-threatening problems as they are identified, and minimizing any delays in initiating transport to an appropriate destination. Developed by the National Association of Emergency Medical Technicians (NAEMT) in cooperation with the American College of Surgeons Committee on Trauma (ASC-COT), PHTLS for First Responders, Second Edition reflects current, evidence-based knowledge and practice, and promotes critical-thinking as the foundation for providing quality care. Rapidly assessing a trauma patient to identify life-saving care is at the heart of PHTLS for First Responders, Second Edition. It takes 2 minutes or less for a patient to exsanguinate. No other intervention first responders perform is more important than stopping that level of bleeding in trauma patients. To reflect this, PHTLS for First Responders, Second Edition utilizes the XABCDE patient assessment mnemonic to place exsanguinating hemorrhage at the forefront of every patient encounter. The importance of XABCDE (exsanguinating hemorrhage, airway, breathing, circulation, disability, and expose/environment) is reinforced in every clinical chapter. PHTLS for First Responders, Second Edition features a new course manual, which reinforces and clarifies key concepts from the course; features an engaging, interactive design; and is written so you feel like you are participating in a conversation, versus listening to a lecture.

The concept behind it is that emergency surgeons and physicians not only need the clinical knowledge to manage the different pathological conditions, but that they must also have a full understanding of diagnostic imaging modalities. To this end, each chapter includes a description of a specific acute abdominal disorder. In addition to the clinical presentation and the diagnosis and management guidelines, there is a special focus on imaging studies with clear and concise descriptions, high-quality images and the evolution grading scale to aid interpretation. This easy-to-read book is an ideal source of practical information for acute care surgeons, radiologists and for all the members of the emergency team.

Tactical Combat Casualty Care Handbook-United States Army 2017-05-17 Tactical Combat Casualty Care (TCCC) has saved hundreds of lives during our nation's conflicts in Iraq and Afghanistan. Nearly 90 percent of combat fatalities occur before a casualty reaches a medical treatment facility. Therefore, the prehospital phase of care is needed to focus on reducing the number of combat deaths. However, few military physicians have had training in this area and, at the onset of hostilities, most combat medics, corpsmen, and pararescue personnel in the U.S. military have been trained to perform battlefield trauma care through civilian-based trauma courses. These courses are not designed for the prehospital combat environment and do not reflect current practices in the area of prehospital care. TCCC was created to train Soldiers and medical personnel on current best practices for medical treatment from the point of injury to evacuation to Role 3 facilities
