Registries for Evaluating Patient Outcomes-Agency for Healthcare Research and Quality/AHRQ 2014-04-01 This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

Health Data in the Information Age-Institute of Medicine 1994-01-01 Regional health care databases are being established around the country with the goal of providing timely and useful information to policymakers, physicians, and patients. But their emergence is raising important and sometimes controversial questions about the collection, quality, and appropriate use of health care data. Based on experience with databases now in operation and in development, Health Data in the Information Age provides a clear set of guidelines and principles for exploiting the potential benefits of aggregated health data--without jeopardizing confidentiality. A panel of experts identifies characteristics of emerging health database organizations (HDOs). The committee explores how HDOs can maintain the quality of their data, what policies and practices they should adopt, how they can prepare for linkages with computer-based patient records, and how diverse groups from researchers to health care administrators might use aggregated data. Health Data in the Information Age offers frank analysis and guidelines that will be invaluable to anyone interested in the operation of health care databases.

Disease Control Priorities, Third Edition (Volume 2)-Robert Black 2016-04-11 The evaluation of reproductive, maternal, newborn, and child health (RMNCH) by the Disease Control Priorities, Third Edition (DCP3) focuses on maternal conditions, childhood illness, and malnutrition. Specifically, the chapters address acute illness and undernutrition in children, principally under age 5. It also covers maternal mortality, morbidity, stillbirth, and influences to pregnancy and pre-pregnancy. Volume 3 focuses on developments since the publication of DCP2 and will also include the transition to older childhood, in particular, the overlap and commonality with the child development volume. The DCP3 evaluation of these conditions produced three key findings: 1. There is significant difficulty in measuring the burden of key conditions such as unintended pregnancy, unsafe abortion, nonsexually transmitted infections, infertility, and violence against women. 2. Investments in the continuum of care can have significant returns for improved and equitable access, health, poverty, and health systems. 3. There is a large difference in how RMNCH conditions affect different income groups; investments in RMNCH can lessen the disparity in terms of both health and financial risk.

Improving the Quality of Health Care for Mental and Substance-Use Conditions-Institute of Medicine 2006-03-29 Each year, more than 33 million Americans receive health care for mental or substance-use conditions, or both. Together, mental and substance-use illnesses are the leading cause of death and disability for women, the highest for men ages 15-44, and the second highest for all men. Effective treatments exist, but services are frequently fragmented and, as with general health care, there are barriers that prevent many from receiving these treatments as designed or at all. The consequences of this are serious--for these individuals and their families; their employers and the workforce; for the nation's economy; as well as the education, welfare, and justice systems. Improving the Quality of Health Care for Mental and Substance-Use Conditions examines the distinctive characteristics of health care for mental and substance-use conditions, including payment, benefit coverage, and regulatory issues, as well as health care organization and delivery issues. This new volume in the Quality Chasm series puts forth an agenda for improving the quality of this care based on this analysis. Patients and their families, primary health care providers, specialty mental health and substance-use treatment providers, health care organizations, health plans, purchasers of group health care, and all involved in health care for mental and substance-use conditions will benefit from this guide to achieving better care.

Primary Care of Women-Karen J. Carlson 2002 This up-to-date and expanded 2 nd edition is an invaluable resource for clinicians committed to providing primary health care to women. It provides a concise, practical synthesis of knowledge from various disciplines, including sections on medical disease, behavioral medicine, and prevention. Coverage focuses on problems commonly seen in primary care practice that occur more frequently or exclusively in women, or that manifest differently or respond differently to treatment in women than men. All topics are thoroughly addressed in a focused, well-organized approach that helps readers quickly locate answers to specific questions. With its focused presentation and clear discussion, Primary Care of Women, 2nd Edition offers an authoritative look at the complexities of a woman's biological, emotional, and social functioning in the context of her physical and mental health. In addition to problems treated mainly by primary care clinicians, content also includes information on conditions managed by specialists, providing a comprehensive source for all women's health considerations. A section on psychology and behavior provides a framework for addressing many of the problems that prompt women to seek medical care, including depression, obesity, and domestic violence. Screening and prevention, essential aspects of primary care practice, are reviewed. The interaction of pregnancy and medical illness is covered, addressing a range of issues including: the effects of specific medical problems on fertility, maternal health, and fetal well-being; the effects of pregnancy on existing diseases; the evaluation and management of problems in early pregnancy; and modification of treatment during pregnancy. An emphasis on clinical decision making and a problem-oriented focus makes this reference practical and useful for the clinical setting, with extensive cross-references, tables, and summaries of management recommendations. Relevant scientific data is included when available to support the book's clinical focus. Attention to the cost-effectiveness of diagnostic and therapeutic interventions is implicitly and explicitly considered, with guidelines for efficient use of subspecialty resources. The patient's preferences are considered key components of the clinical decision-making process, offering tips for patient education such as what the patient can expect from specific tests or treatments as well as the probabilities of various treatment outcomes. Coverage of problems affecting aging women, including memory loss/Alzheimer's and degenerative arthritis, has been expanded. More subspecialties are represented in this edition, covering topics specific to allergy, chronic pain management, oral surgery, sports medicine, and more. Special populations of women, such as disabled and homeless women, are included with specific treatment considerations where appropriate. New topics are addressed in this edition, including: pulmonary disorders, sleep disorders, sports injuries, chronic pain syndromes. New chapters have been added on: hypertension, allergy, temporomandibular joint syndrome, memory loss/Alzheimer's, GERD/peptic ulcer disease, and chronic cough. Material on topics such as menopause, osteoporosis, obesity, breast cancer, and diabetes, has been thoroughly revised.
The Organization of Maternity Care-Rona Campbell 1997 Accurate evaluation is an essential tool for the continuous improvement of midwifery services. This unique book provides comprehensive guidance on planning and carrying out research to generate valuable results. The difficult processes of economic evaluation and audit are explained in detail, with supporting case histories.
