The Oxford Handbook of Emotion, Social Cognition, and Problem Solving in Adulthood-Paul Verhaeghen 2016-03-09 Over the last decade, the field of socio-emotional development and aging has rapidly expanded, with many new theories and empirical findings emerging. This trend is consistent with the broader movement in psychology to consider social, motivational, and emotional influences on cognition and behavior. The Oxford Handbook of Emotion, Social Cognition, and Problem Solving in Adulthood provides the first overview of a new field of adult development that has emerged out of conceptualizations and research at the intersections between socioemotional development, social cognition, emotion, coping, and everyday problem solving. This field roundly rejects a universal deficit model of aging, highlighting instead the dynamic nature of socio-emotional development and the differentiation of individual trajectories of development as a function of variation in contextual and experiential influences. It emphasizes the need for a cross-level examination (from biology and neuroscience to cognitive and social psychology) of the determinants of emotional and socio-emotional behavior. This volume also serves as a tribute to the late Fredda Blanchard-Fields, whose thinking and empirical research contributed extensively to a life-span developmental view of emotion, problem solving, and social cognition. Its chapters cover multiple aspects of adulthood and aging, presenting developmental perspectives on emotion; antecedents and consequences of emotion in context; everyday problem solving; social cognition; goals and goal-related behaviors; and wisdom. The landmark volume in this new field, The Oxford Handbook of Emotion, Social Cognition, and Problem Solving in Adulthood is an important resource for cognitive, developmental, and social psychologists, as well as researchers and graduate students in the field of aging, emotion studies, and social psychology.

Psychology of Music-Diana Deutsch 2013-10-22 The Psychology of Music draws together the diverse and scattered literature on the psychology of music. It explores the way music is processed by the listener and the performer and considers several issues that are of importance both to perceptual psychology and to contemporary music, such as the way the sound of an instrument is identified regardless of its pitch or loudness, or the types of information that can be discarded in the synthetic replication of a sound without distorting perceived timbre. Comprised of 18 chapters, this book begins with a review of the classical psychoacoustical literature on tone perception, focusing on characteristics

of particular relevance to music. The attributes of pitch, loudness, and timbre are examined, and a summary of research methods in psychoacoustics is presented. Subsequent chapters deal with timbre perception; the subjective effects of different sound fields; temporal aspects of music; abstract structures formed by pitch relationships in music; different tests of musical ability; and the importance of abstract structural representation in understanding how music is performed. The final chapter evaluates the relationship between new music and psychology. This monograph should be a valuable resource for psychologists and musicians.

The Mind and its Stories-Patrick Colm Hogan 2003-09-29 There are profound, extensive, and surprising universals in literature, which are bound up with universals in emotion. Hogan maintains that debates over the cultural specificity of emotion are misdirected because they have ignored a vast body of data that bear directly on the way different cultures imagine and experience emotion - literature. This is the first empirically and cognitively based discussion of narrative universals. Professor Hogan argues that, to a remarkable degree, the stories people admire in different cultures follow a limited number of patterns and that these patterns are determined by cross-culturally constant ideas about emotion. In formulating his argument, Professor Hogan draws on his extensive reading in world literature, experimental research treating emotion and emotion concepts, and methodological principles from the contemporary linguistics and the philosophy of science. He concludes with a discussion of the relations among narrative, emotion concepts, and the biological and social components of emotion.

New Dramaturgy-Katalin Trencsényi 2014-04-24 Recent shifts in the theatrical landscape have had corresponding implications for dramaturgy. Feeling Beauty-G. Gabrielle Starr 2013-07-19 A theory of the neural bases of aesthetic experience across the arts, which draws on the tools of both cognitive neuroscience and traditional humanist inquiry. In Feeling Beauty, G. Gabrielle Starr argues that understanding the neural underpinnings of aesthetic experience can reshape our conceptions of aesthetics and the arts. Drawing on the tools of both cognitive neuroscience and traditional humanist inquiry, Starr shows that neuroaesthetics offers a new model for understanding the dynamic and changing features of aesthetic life, the relationships among the arts, and how individual differences in aesthetic judgment shape the varieties of aesthetic experience. Starr, a scholar of the humanities and a researcher in the neuroscience of aesthetics, proposes that aesthetic experience relies on a distributed neural architecture—a set of brain areas involved in emotion, perception, imagery, memory, and language. More important, it emerges from networked interactions, intricately connected and coordinated brain systems that together form a flexible architecture enabling us to develop new arts and to see the world around us differently. Focusing on the "sister arts" of poetry, painting, and music, Starr builds and tests a neural model of aesthetic experience valid across all the arts. Asking why works that address different senses using different means seem to produce the same set of feelings, she examines particular works of art in a range of media, including a poem by Keats, a painting by van Gogh, a sculpture by Bernini, and Beethoven's Diabelli Variations. Starr's innovative, interdisciplinary analysis is true to the complexities of both the physical instantiation of aesthetics and the realities of artistic representation.

The Handbook of Emotion and Memory-Sven-Ake Christianson 2014-02-04 This important volume defines the state of the art in the field of emotion and memory by offering a blend of research review, unpublished findings, and theory on topics related to its study. As the first contemporary reference source in this area, it summarizes findings on implicit and explicit aspects of emotion and memory, addresses conceptual and methodological difficulties associated with different paradigms and current procedures, and presents broad theoretical perspectives to guide further research. This volume articulates the accomplishments of the field and the points of disagreement, and gives the brain, clinical, and cognitive sciences an invaluable resource for 21st-century researchers. Citing and analyzing the results of experiments as well as field and case studies, the chapters are organized around methodological approaches, biological-evolutionary perspectives, and clinical perspectives, and bring together experts in neuroscience, and both cognitive and clinical psychology. Questions addressed include: * What is the nature of emotional events and what do we retain from them? * Is there something about emotional events that causes them to be processed differently in memory? * Do emotional memories have special characteristics that differ from those produced by "ordinary" memory mechanisms or systems? * Do people with emotional disturbances remember differently than normal people? * Which factors play the most crucial role in functional amnesia?

Social Anxiety-Stefan G. Hofmann 2014-07-15 The third edition of Social Anxiety: Clinical, Developmental, and Social Perspectives integrates examinations of social anxiety, shyness, and embarrassment with the research on social anxiety disorder subtypes, biological theories and cognitive-behavioral or pharmacological treatment outcome studies. Clinicians, social and developmental psychologists and behavioral geneticists have all conducted research over the

past ten years which is essential to furthering our understanding and treatment of social anxiety disorders. This book weaves together research findings gathered by renowned minds across these various disciplines, and deals with both theory and research. It explores what constitutes social anxiety, assesses the condition and its relationship to other psychological disorders, exploring the biological basis and treatment approaches as well. Coverage includes key issues not discussed fully by other books, including related disorders in adults and children, relationship to social competence and assertiveness, perfectionism, social skills deficit hypothesis, comparison between pharmacological and psychosocial treatments, and potential mediators of change in the treatment of social anxiety disorder. From the Author: Although social anxiety disorder (social phobia) is widely researched topic in psychiatry, other disciplines, such as social and developmental psychology, have independently been studying the same phenomena for many years. Yet, there has been very little cross-discipline communication and integration. The main objective of the book is to integrate the findings on social anxiety from various disciplines, including clinical psychology, psychiatry, social psychology, neuroscience, and developmental psychology. The most comprehensive source of up-to-date data, with review articles covering a thorough delineation of social anxiety, theoretical perspectives, and treatment approaches Consolidates broadly distributed literature into single source Each chapter is written by an expert in the topic area, providing more fully vetted expert knowledge than any existing work Integrates findings from various disciplines — clinical, social and developmental psychology, psychiatry, neuroscience — rather than focusing on only one conceptual perspective Provides a complete understanding of a complex phenomenon, giving researchers and clinicians alike a better set of tools for furthering what we know

Stress in Health and Disease, An Issue of Psychiatric Clinics of North America.-Daniel L. Kirsch 2014-12-27 Stress in the DSM is referred to only in the sense of post traumatic stress disorder (PTSD). This issue of Psychiatric Clinics of North America discusses the scientific medical facets of stress, written by mental health and medical practitioners. It looks at the brain-body connection of stress – what the body does to result in stress and varying results stress has on the body. This fascinating cross-discipline look at stress is intended for psychiatrists, general practitioners, cardiologists, GI specialists, neurologists, sleep medicine specialists, respiratory specialists, and others who diagnose and treat patients with stress suspected as part of the illness equation or with self-reported stress. Topics include: Measurement of stress; Anxiety and stress-how they work together; Relationship between genetics and stress; Role of glia in stress; Sleep and stress; Diet and stress; Supplements and stress; Effect of severe stress on early brain development, attachment, and emotions; Role of stress and fear on the development of psychopathology; Expressions of stress in psychiatric illness; Dermatologic manifestations of stress in normal and psychiatric populations; Humor and the psychological buffers of stress; Stress expression in children and adolescents; Stress in service members; Stress in the geriatric population.
