Invasion of the Prostate Snatchers-Mark Scholz 2010-08-24 Every year almost a quarter of a million confused and frightened American men are tossed into a prostate cancer cauldron stirred by salespeople representing a multibillion-dollar industry. In this flourishing business, the radical prostatectomy is still the most widely recommended treatment option. Yet a recent and definitive study in the New England Journal of Medicine concluded that out of the fifty thousand prostate operations performed annually, more than forty thousand are unjustified. But this is no surprise given that 99 percent of all doctors treating this disease are surgeons or radiation therapists. The appalling fact is that men are still being rushed into a major operation that rarely prolongs life and more than half the time leaves them impotent. Invasion of the Prostate Snatchers is a report on the latest thinking in prostate cancer therapy: close monitoring-active surveillance rather than surgery or radiation-should be the initial treatment approach for many men. There are three stages of prostate cancer and this book will provide accurate information about how to distinguish between them: Low-Risk, which requires no immediate treatment; Intermediate-Risk, which will benefit from surgery, radiation, and/or hormonal therapy; and High-Risk, a type that does require immediate treatment with a combination of therapies. In a unique collaboration, doctor and patient provide a wholly new perspective on managing this disease. Ralph Blum's account of his personal struggle, together with Dr.Mark Scholz's presentation of newscientific advances, provides convincing evidence that this noninvasive approach can be crucial in preventing tens of thousands of men from being overtreated every year. Invasion of the Prostate Snatchers serves as an indispensable map through the medical minefield of prostate cancer.

Ensuring Quality Cancer Care-Institute of Medicine and National Research Council 1999-07-21 We all want to believe that when people get cancer, they will receive medical care of the highest quality. Even as new scientific breakthroughs are announced, though, many cancer patients may be getting the wrong care, too little care, or too much care, in the form of unnecessary procedures. How close is American medicine to the ideal of quality cancer care for every person with cancer? Ensuring Quality Cancer Care provides a comprehensive picture of how cancer care is delivered in our nation, from early detection to end-of-life issues. The National Cancer Policy Board defines quality care and recommends how to monitor, measure, and extend quality care to all people with cancer. Approaches to accountability in health care are reviewed. What keeps people from getting care? The book explains how lack of medical coverage, social and economic status, patient beliefs, physician decision-making, and other factors can stand between the patient and the best possible care. The board explores how cancer care is shaped by the current focus on evidence-based medicine, the widespread adoption of managed care, where services are provided, and who provides care. Specific shortfalls in the care of breast and prostate cancer are identified. A status report on health services research is included. Ensuring Quality Cancer Care offers wide-ranging data and information in clear context. As the baby boomers approach the years when most cancer occurs, this timely volume will be of special interest to health policy makers, public and private healthcare purchasers, medical professionals, patient advocates, researchers, and people with cancer.

Main messages from the volume include: -Quality matters in all aspects of cancer treatment and palliation. -Cancer registries that track incidence, mortality, and survival † paired with systems to capture causes of death are important to understanding the national cancer burden and the effect of interventions over time. -Effective interventions exist at a range of prices. Adopting "resource appropriate" measures which allow the most effective treatment for the greatest number of people will be advantageous to countries. -Prioritizing resources toward early stage and curable cancers is likely to have the greatest health impact in low income settings. -Research prioritization is no longer just a global responsibility. Providing cancer treatment requires adequate numbers of trained healthcare professionals and infrastructure beyond what is available in most LMICs, especially low income countries. Careful patient monitoring is a requirement of good quality cancer care and this often involves laboratory tests in addition to clinical examination.
