Radio Frequency Integrated Circuits and Technologies-Frank Ellinger 2008-08-14 The restrictions inherent in the scaling of device dimensions to meet the increasing capacities of communications systems make the design of radio frequency circuits a tough task. This book covers all the multidisciplinary issues of that task.

Introduction to Microelectronic Fabrication-Richard C. Jaeger 2002 This introductory book assumes minimal knowledge of the existence of integrated circuits and of the terminal behavior of electronic components such as resistors, diodes, and MOS and bipolar transistors. It presents to readers the basic information necessary for more advanced processing and design books. Focuses mainly on the basic processes used in fabrication, including lithography, oxidation, diffusion, ion implantation, and thin film deposition. Covers interconnection technology, packaging, and yield. Appropriate for readers interested in the area of fabrication of solid state devices and integrated circuits.

High-Speed CMOS Circuits for Optical Receivers-Jafar Savoy 2007-05-08 With the exponential growth of the number of Internet nodes, the volume of the data transported on the backbone has increased with the same trend. The load of the global Internet backbone will soon increase to tens of terabits per second. This indicates that the backbone bandwidth requirements will increase by a factor of 50 to 100 every seven years. Transportation of such high volumes of data requires suitable media with low loss and high bandwidth. Among the available transmission media, optical fibers achieve the best performance in terms of loss and bandwidth. High-speed data can be transported over hundreds of kilometers of single-mode fiber without significant loss in signal integrity. These fibers progressively benefit from reduction of cost and improvement of perfor- mance. Meanwhile, the electronic interfaces used in an optical network are not capable of exploiting the ultimate bandwidth of the fiber, limiting the throughput of the network. Different solutions at both the system and the circuit levels have been proposed to increase the data rate of the backbone. System-level solutions are based on the utilization of wave-division multiplexing (WDM), using different colors of light to transmit se- eral sequences simultaneously. In parallel with that, a great deal of effort has been put into increasing the operating rate of the electronic transceivers using highly-developed fabrication processes and novel c- cuit techniques.

Electronic Test Instruments-Robert A. Witte 2002 Electronic Test Instruments: Analog and Digital Measurements, Second Edition offers a thorough, unified, up-to-date survey of electronics instrumentation, digital and analog. Start with basic measurement theory, then master all mainstream forms of electronic test equipment through real-world application examples. This new edition is now fully updated for the latest technologies, with extensive new coverage of digital oscilloscopes, power supplies, and more.

The RF Microwave Handbook- 2008

Biochemistry Laboratory-Rodney F. Boyer 2006 KEY BENEFIT: Many biochemistry lab instructors are now opting to either design their own experiments or select them from major educational journals. Biochemistry Laboratory: Modern Theory and Techniques addresses this issue by providing a flexible alternative without experimental protocols. Instead of requiring instructors to use specific experiments, the book focuses on detailed descriptions of modern techniques in experimental biochemistry and discusses the theory behind such techniques in detail. Part I: Theory and Experimental Techniques, Introduction to the Biochemistry Laboratory, The Computer as a Tool in Biochemistry and Molecular Biology, General Laboratory Procedures, Centrifugation Techniques in Biochemistry, Purification and Identification of Biomolecules by Chromatography, Characterization of Proteins and Nucleic Acids by Electrophoresis, Spectroscopic Analysis of Biomolecules, Biomolecular Interactions: Ligand Binding and Enzyme Reactions, Molecular Biology I: Structures and Analysis of Nucleic Acids, Molecular Biology II: Recombinant DNA, Molecular Cloning, and Enzymology, Protein Production, Purification, and Characterization, Part II: Teaching the Biochemistry/Molecular Biology Lab, A Brief History, A Variety of Teaching Methods, Essential BMB Concepts and Skills for Student Learning, Experiments in Biochemistry and Molecular Biology KEY MARKET: For all readers interested in laboratory experiments.
