The Art of Discussion-Based Teaching-John Henning 2007-10-18 Opening Up the Conversation leads practicing and preservice K-12 teachers through the process of creating more open, student-centered discourse in their classrooms. Readers are first introduced to types of teacher questions, student responses, and teacher follow-up moves that are associated with both open and closed discourse. Author John Henning then helps readers identify the most likely places for open and closed classroom discourse by examining an entire unit of instruction and by looking closely at three distinct types of discussions—framing, conceptual, and application. Readers are introduced to specific discourse moves, the patterns of discussion, the amount of preparation, and the types of accountability strategies needed to construct each of these discussions. The final chapter of the book shows readers how to videotape and analyze their classroom interactions in a teacher study group.

Physical Geology-Steven Earle 2019 "Physical Geology is a comprehensive introductory text on the physical aspects of geology, including rocks and minerals, plate tectonics, earthquakes, volcanoes, glaciation, groundwater, streams, coasts, mass wasting, climate change, planetary geology and much more. It has a strong emphasis on examples from western Canada, especially British Columbia, and also includes a chapter devoted to the geological history of western Canada. The book is a collaboration of faculty from Earth Science departments at Universities and Colleges across British Columbia and elsewhere"--BCcampus website.

Himalayan Tectonics-P.J. Treloar 2019-10-08 The Himalaya-Karakoram-Tibet mountain belt resulted from Cenozoic collision of India and Asia and is frequently used as the type example of a continental collision orogenic belt. The last quarter of a century has seen the publication of a remarkably detailed dataset relevant to the evolution of this belt. Detailed fieldwork backed up by state-of-the-art structural analysis, geochemistry, mineral chemistry, igneous and metamorphic petrology, isotope chemistry, sedimentology and geophysics produced a wide-ranging archive of data-rich scientific papers. The rationale for this book is to provide a coherent overview of these datasets in addressing the evolution of the mountain ranges we see today. This volume comprises 21 specially invited review papers on the Himalaya, Kohistan arc, Tibet, the Karakoram and Pamir ranges. These papers span the history of Himalayan research, chronology of the collision, stratigraphy, magmatic and metamorphic processes, structural geology and tectonics, seismicity, geophysics, and the evolution of the Indian monsoon. This landmark set of papers should underpin the next 25 years of Himalayan research.

A Traveler's Guide to the Geology of Egypt-Bonnie M. Sampsell 2003 Egypt is primarily a land of deserts and mountains, the habitable Nile Valley and Delta occupying less than 5 percent of the country. Although the ancient Egyptians lived on only a small fraction of the land, they made extensive use of resources from the less hospitable areas, exploiting the opportunities and adjusting to the constraints of their physical environment. The Geology of Egypt: A Traveler's Guide describes these features and more, providing for the first time a guide for the traveler to Egypt interested in learning about its history from a different perspective. The guidebook presumes no background in geology or related fields and provides an introduction to the relevant geological concepts, presenting examples to illustrate how the country's geological features influenced Egyptian civilization. Most examples are selected from the pharaonic period and Greco-Roman period, though many cases also illustrate how geological factors continue to have an impact on modern Egyptian society. The text is organized as a trip on the Nile from Lake Nasser downstream to the Delta, with chapters devoted to such popular sites as Aswan, Luxor, and Giza. Also covered are the Eastern and Western Deserts, as well as the Sinai Peninsula. Maps, illustrations, photographs, and an extensive glossary help make a complex but intriguing subject accessible to everyone.

Smarts-Susan Custer 1995 This book offers study strategies and techniques which were originally used in resource rooms for students with mild disabilities but are appropriate for all students, all content areas, and all educational levels. The book is structured around the acronym SMARTS for the six action steps or skills covered: (1) Studying, (2) Memorizing, (3) Active listening, (4) Reviewing, (5) Test-taking, and (6) Survival skills. The book begins with a study skills inventory and a group text inventory. Activities to foster listening skills are then offered, including eight awareness activities and five activities for fostering listening comprehension. The next section suggests 12 activities to help students learn to follow directions. A section on organizational skills gives tips on use of an organizational notebook, assignment sheets, and instant study skills. Suggestions for the effective use of textbooks describe the SQ3R (Survey, Question, Read, Recite, Review) technique and the use of text study helps. Suggestions for note-taking and ideas for building vocabulary are also offered. A section on memory and review suggests a variety of memory aids and the use of learning logs and study guides. The final section offers suggestions for taking tests and some survival skill strategies for students and teachers. An appendix explains the Fry formula for assessing readability. (DB)
